Merging Text Files (Practice)

Section 3, Lecture 70

Here is a tricky exercise.

1. Please download the three text files attached in this lecture and put them in a folder. The first text file contains the text `Content1` . The second contains `Content2` and the third `Content3` .

2. You should create a Python script that generates a new text file which should contain the content of all three text files. So the generated file should have this content:

`Content1``Content2``Content3`

In other words, your Python script should merge the three text files.

3. Also, the name of the output file should be the current timestamp.
Example: `2017-11-01-13-57-39-170965.txt`

You have some tips in the next lecture and the solution in the lecture after that.

Resources for this lecture

 `file1.txt`

 `file2.txt`

 `file3.txt`
